Microclimatic considerations

Kengo Kuma

Outward spreading walls cannot be built with thermal mass though they can be insulated
Remote corners are difficult to hold at the same temperature as the core of the building
Snohetta

Shows promise: water as a temperature buffer with slow annual cycle. Compact surfaces to the air. Needs to float if sea level rises.
Rex

A variant on the Denver Art Museum
Sutherland Hussey

Seems to have box within a glass facade. This lets in more solar energy than necessary.
Delugan Meissl

Large air surface to volume ratio. Little chance of adding thermal inertia.
